# Solana: ($SOL)

## Fund: MBF

Investment Presentation

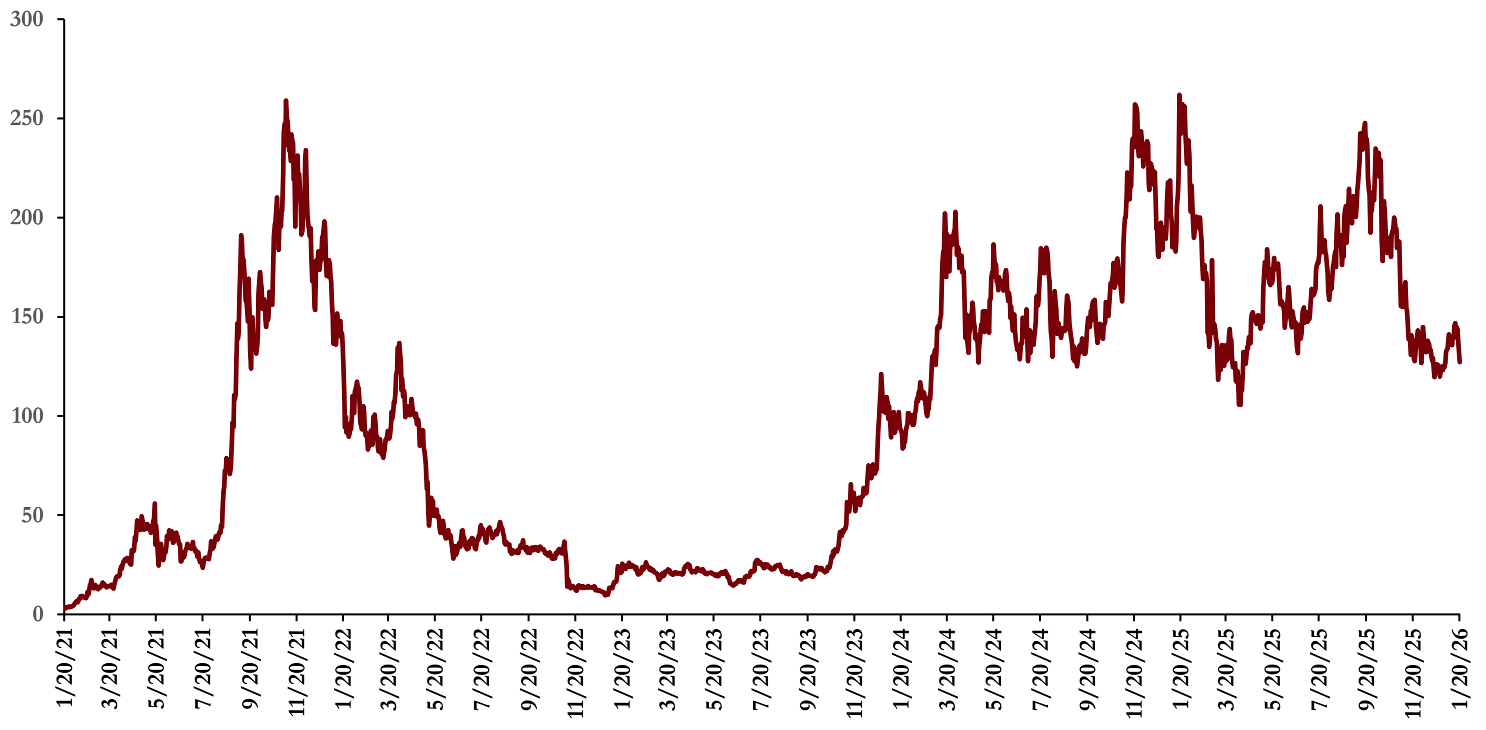
**Pitch Team:** Amit Kopolovic, Aiden Colleary, Nathan Sousa, Vincent Hill

January 2026

# Solana Overview

Solana is a high-performance, Layer 1 blockchain platform founded by Anatoly Yakovenko in 2017 and launched in 2020. The network is designed to support fast, low-cost, and scalable decentralized applications. Solana uses the consensus mechanisms Proof of History, which Anatoly invented, as well as Proof of Stake. Solana enables a broad range of use cases including decentralized finance (DeFi), NFTs, payments, gaming, and real-world asset tokenization. Its native token, SOL, is used for transaction fees, staking, and network security. Solana has become one of the leading smart-contract platforms by developer activity and ecosystem growth, positioning itself as infrastructure for consumer-scale blockchain applications.

## Solana Performance



| Token Price | $129.16 |
|---|---|
| Fully Diluted Market Cap | $79.4 B |
| Circulating Market Cap | $72.6 B |
| All Time Volume | $5.3 T |
| P/F (Circulating) | 292.8x |
| Token Turnover (Circulating) | 4% |

MBF
Minutemen Blockchain Fund

# Team Quality & Management

**Anatoly Yakovenko**
*Founder & CEO*

**Anatoly helped design Solanas consensus mechanism, ultimately inventing PoH.**

Prior experience:
Software engineer at
- Dropbox,
- Qualcomm
- Mesosphere

**Greg Fitzgerald**
*Co-Founder & CTO*

**Greg turned the PoH concept into real functional blockchain technology.**

- Worked alongside Anatoly at Qualcomm, focused on embedded systems and engineering
- Master of programming tools such as Rust, C++, Python, & Haskell

**Eric Williams**
*Co-Founder & Chief Scientist*

**Eric serves as head of tokenomics and data modeling.**

- Performed "missing energy" research on proton collisions at CERN as part of his Ph.D. in Physics from Columbia
- Previously led data science and analytics at Omada Health

# Market Creation Story

***Old World***

- Blockchains were too slow and expensive for real-time or consumer-scale use
- On-chain activity was limited to infrequent financial transactions

***Why Now***

- Solana processes transactions quickly and cheaply on a single, unified network (Attempting to solve the Blockchain trilemma with PoH)
- Developers and users avoid fragmented systems that break liquidity and user experience

***New Market Created***

- Makes real-time, consumer-scale on-chain applications viable
- Enables new categories like payments, consumer apps, and high-frequency DeFi
- Expands crypto from niche finance into a general-purpose execution layer

# Current Adoption

**"Solana's RWA ecosystem has surpassed $1 billion in total value locked (TVL), driven by a 25.66% month-over-month increase in capital inflows... Major players such as BlackRock's USD Institutional Digital Liquidity Fund, PRIME, and Ondo U.S. Dollar Yield collectively hold a significant portion of the TVL"**

## Massive On Chain Usage

- TVL now sits at $35B compared to its $3B in 2023
- 162M+ daily transactions and 3-6M daily active addresses

Solanas on-chain growth reflects genuine utility, rather than pure speculation

## Institutional Capital

- U.S. spot Solana ETFs launched in Q4 2025, marking an inflection point
- ETF inflows drove a ~23% increase in on-chain liquidity despite risky macro sentiment

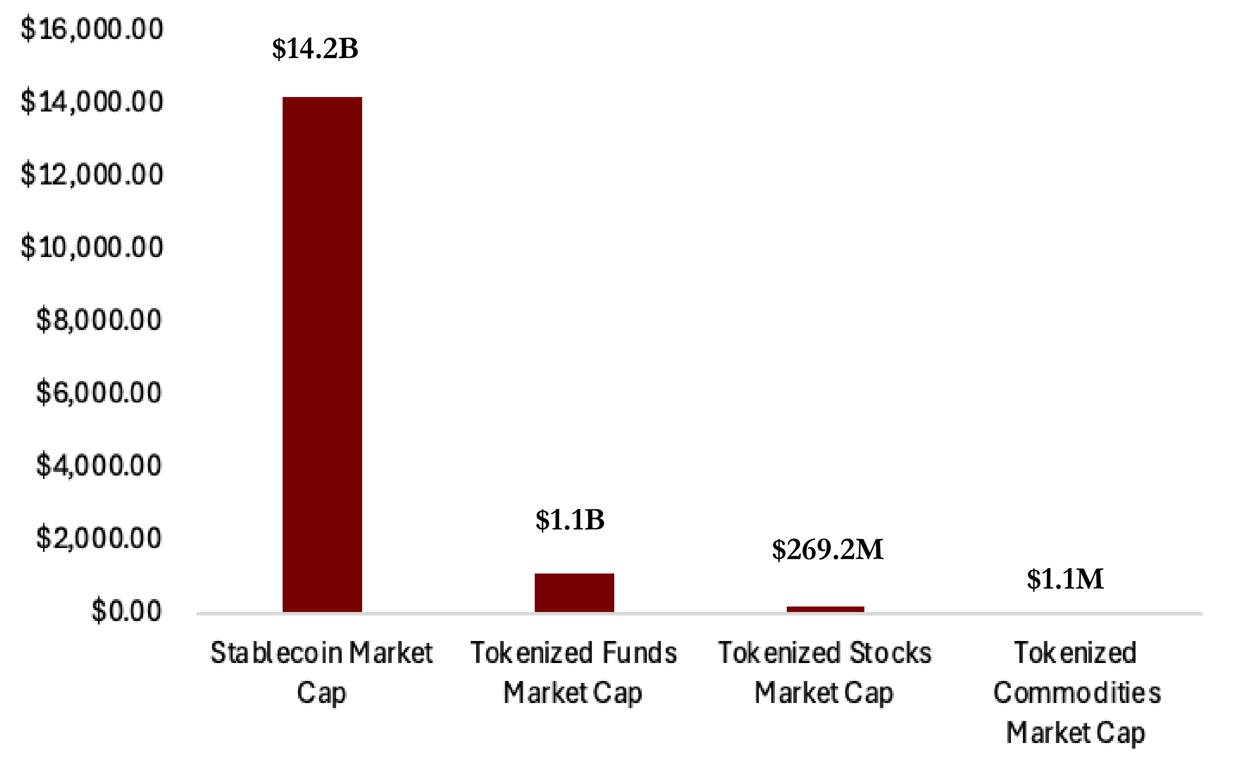
ETF access shifts SOL from a retail asset to a capital markets instrument

## Stablecoins & RWA's as the Core Use-Case

- Stablecoin supply on Solana currently sits at around $17B
- Stablecoins represent the largest and fastest growing share of Solanas TVL
- Institutional issuers (Paypal, Paxos) are beginning to use Solana for regulated, real-world financial flows

Stablecoins transform Solana from retail hype to financial infrastructure

## Solana's RWA Ecosystem



# Future Use Case/Big Vision

### Speculative On-Chain Activity

- DeFi Apps are created
- Over 60% of memecoin volume on the SOL chain
- SOL converted to stablecoins

→

### On-Chain Capital Markets

- Users trade tokenized equities, bonds, & other funds
- Government bonds and corporate debt

### Stablecoin Utility

- High frequency transfers
- Low fees lead to retail usage
- UX hides gas & wallets

→

### Global Payments

- Consumer & merchant payments
- Cross-border Settlement
- Users don't know they are on Chain

### Digital Ownership

- Gaming and creator collectibles
- Large NFT marketplaces: Magic Eden & Solanart

→

### Collectibles to Real Assets

- NFT's representing & backed by physical assets: real estate, art, luxury goods
- Fractional ownership of RWA's
- Integrated NFT apps: Memberships, loyalty points, tickets, passes

*Solana becomes invisible infrastructure—powering real-world finance and consumer applications without users ever realizing they're on-chain.*

# Partnerships & Developments

## Prediction Markets & DeFi Integration

- Kalshi tokenized its event contracts on Solana, expanding regulated prediction market activity on-chain
- Coinbase plans SOL trading tied to Kalshi liquidity.

## Broader Moves

- Blockasset is powering a UFC digital fan engagement platform through SOL offering unique rewards and experiences.
- Through Sorare NFT sports cards are being minted and traded with SOL

## Big Tech & Financial Infrastructure

- Partnerships with PayPal, Visa, and stablecoin integrations.
- Institutional interest from Franklin Templeton and others bridging between TradFi and blockchain.

## Consumer & Mobile Web3

- Solana Mobile is building the Seeker phone with built-in wallets and Web3 integration to bring crypto to everyday users.

# Speed & Efficiency as a Defensive Moat

## High-Performance Execution Layer

**Parallel Execution**

- Sea-level allows thousands of smart contracts to run simultaneously

**Sub-Second Finality**

- ~400–600ms confirmation enables real-time applications

**Ultra-Low Fees**

- ~$0.0001–$0.01 per transaction supports consumer-scale usage

**Throughput**

- 50,000+ TPS (theoretical capacity)
- ~2,000–4,000 TPS sustained in production

*Performance enables applications that cannot exist on slower, higher-cost blockchains — creating long-term switching costs.*

# Vesting, Unlocks & Dilution

| Vesting | Unlocks | Dilution |
|---|---|---|
| • Team and early contributors were subject to multi-year vesting<br>• Most insider allocations are already fully vested<br>• Limited remaining insider vesting overhang | • No major near-term insider unlock cliffs<br>• Circulating supply growth is gradual and predictable<br>• New supply primarily comes from staking emissions | • Team and early contributors vested over multiple years<br>• Majority of insider allocations already vested<br>• Limited remaining insider vesting overhang |

*Inflation is predictable, declining, and tied to securing the network — not insider selling.*

# SOL Reserve Supply Distribution

<u>Key Takeaway:</u> Large holders of Solana are well-known institutional, strategy-driven investors either looking for crypto exposure or treasury diversification - Big name holders don't dominate the network.

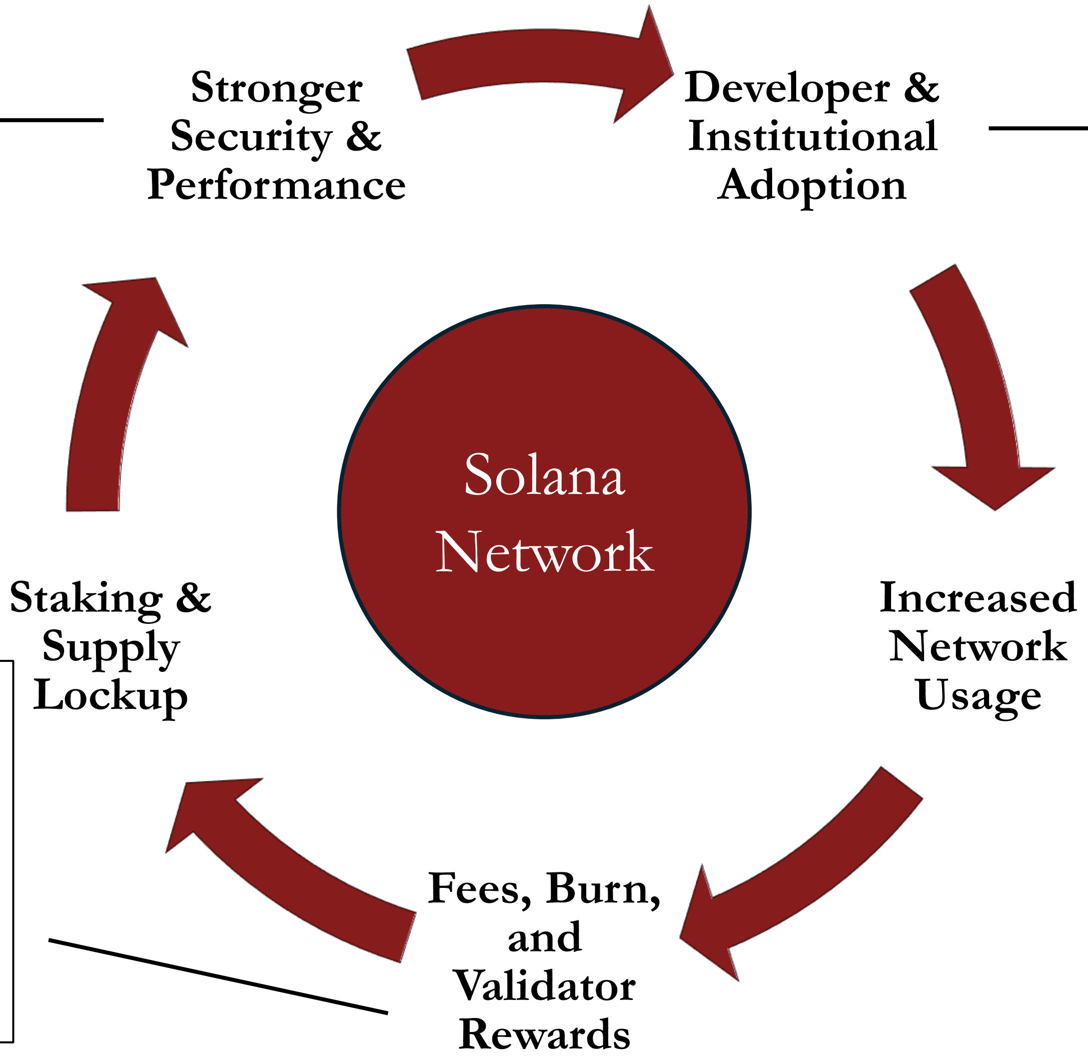
- Top 9 combined holders own only around 3% of SOL
- Many owners are either staked, or have a long-term outlook of SOL
- Presence of institutional investors provides credibility and investor sentiment

| Holder | SOL# (in millions) | % of total SOL supply | Rationale |
|---|---|---|---|
| Forward Industries | 6.91 | 1.117% | Treasury Diversification |
| Solana Company | 2.3 | 0.372% | Foundatinal Ownership |
| DeFi Development Corp | 2.19 | 0.355% | Exposure to DeFi |
| Upexi | 2.02 | 0.326% | Investment Strategy |
| Sharps Technology | 2 | 0.323% | Balance Sheet Strategy |
| Yueda Digital Holding | 0.75 | 0.121% | L1 Exposure |
| Galaxy Digital Holdings | 0.66 | 0.107% | Investment Strategy |
| Pheonix Group | 0.64 | 0.104% | Infrustructure Operator |
| SOL Strategies | 0.523 | 0.085% | Investment Strategy |

# Value Capture Flywheel

Higher SOL staked = higher network security,
**Effect: Better UX attracts more builders & institutions**

Builders initiate payments, gaming, & RWA apps, while institutions use Solana for Stablecoin Settlements, tokenized assets, & ETFS
**Effect: Legitimate use cases = durable activity**



Validators stake SOL to secure the network. Staked SOL is then removed from liquid supply
**Effect: Demanded rises while supply tightens**

SOL Volume Increases, active wallets increases, transactions scale
**Effect: Every transaction requires Solana**

Transaction fees are required to be paid in SOL while a small portion of the fee is burned creating further scarcity and the remaining fee is awarded to validators
**Effect: Usage directly ties to value capture**

# Comparable Token Analysis

| Coin | Ticker | Price | TVL ($B) | Market Cap ($B) |
|---|---|---|---|---|
| Solana | SOL | 128.1 | 31.4 | 72.4 |
| **Layer 1's** | | | | |
| Ethereum | ETH | 2950.56 | 332.8 | 361.4 |
| Sui | SUI | 1.49 | 2.6 | 5.7 |
| Avalanche | AVAX | 12.16 | 3.8 | 5.2 |
| Cardano | ADA | 0.36 | 0.169 | 13.2 |

| Coin | Ticker | Transactions Per Second (TPS) | Block Time (Secs) | Average Transaction Fee |
|---|---|---|---|---|
| Solana | SOL | 3,300 | 0.398 | 0.0032 |
| **Layers 1's** | | | | |
| Ethereum | ETH | 28.6 | 12 | 0.226 |
| Sui | SUI | 120 | 0.48 | 0.002 |
| Avalanche | AVAX | 27.7 | 1.2 | 0.003 |
| Cardano | ADA | 7 | 20 | 0.15 |

# Upside Case

| What Needs To Happen |
| --- |

- Overall growth of Crypto and need for Layer 1's for building
- Institutional investment through ETF's
- Strategic Reserves opened by Companies and Countries
- Greater volume in consumer Solana transactions through token, NFT's, etc.
- Decentralized exchanges (DEXs) on Solana grow in popularity

In an upside case Solana experiences no major outages and able to meet all transaction demand at low costs

Build a reputation of high validation and reliability as a network
Developers building projects on Solana to expand and improve the network

# Zero Case

**Regulation:** Global regulators could classify tokens as securities or restrict DeFi activity, limiting adoption or freezing parts of the ecosystem.

**Competition:** Other L1 blockchains (Ethereum, Avalanche, Aptos, Sui) could attract developers and users with better decentralization, lower costs, or stronger ecosystems.

**Incentives Breaking:** Misaligned validator economics, token unlocks, or staking issues could reduce network security or participation, undermining trust.

**Tech / Outages:** Past network downtime or potential future bugs could erode confidence, delay adoption, or drive projects to other chains.

**Ecosystem Dependence:** Heavy reliance on developer tools, bridges, or dApps means key failures elsewhere could cascade onto Solana.
on:

*Solana could fail if regulatory, competitive, economic, technical, or ecosystem risks prevent adoption or compromise network security.*

# Investment Recommendation

We believe Solana represents a top-tier seed investment opportunity in the Layer 1 blockchain ecosystem. Solana possesses unparalleled speed and significantly low transaction costs, built for high volume and real-world use cases. As institutional adoption accelerates, Solana is increasingly positioned as infrastructure for stablecoin settlement, tokenized equities and bonds, on-chain payments, and real-world asset issuance.

Position: Long

Time Horizon:
**Long-Term Hold**

# Thank you for listening!
