

Bose Blockchain

Fund: MBF

Investment Presentation

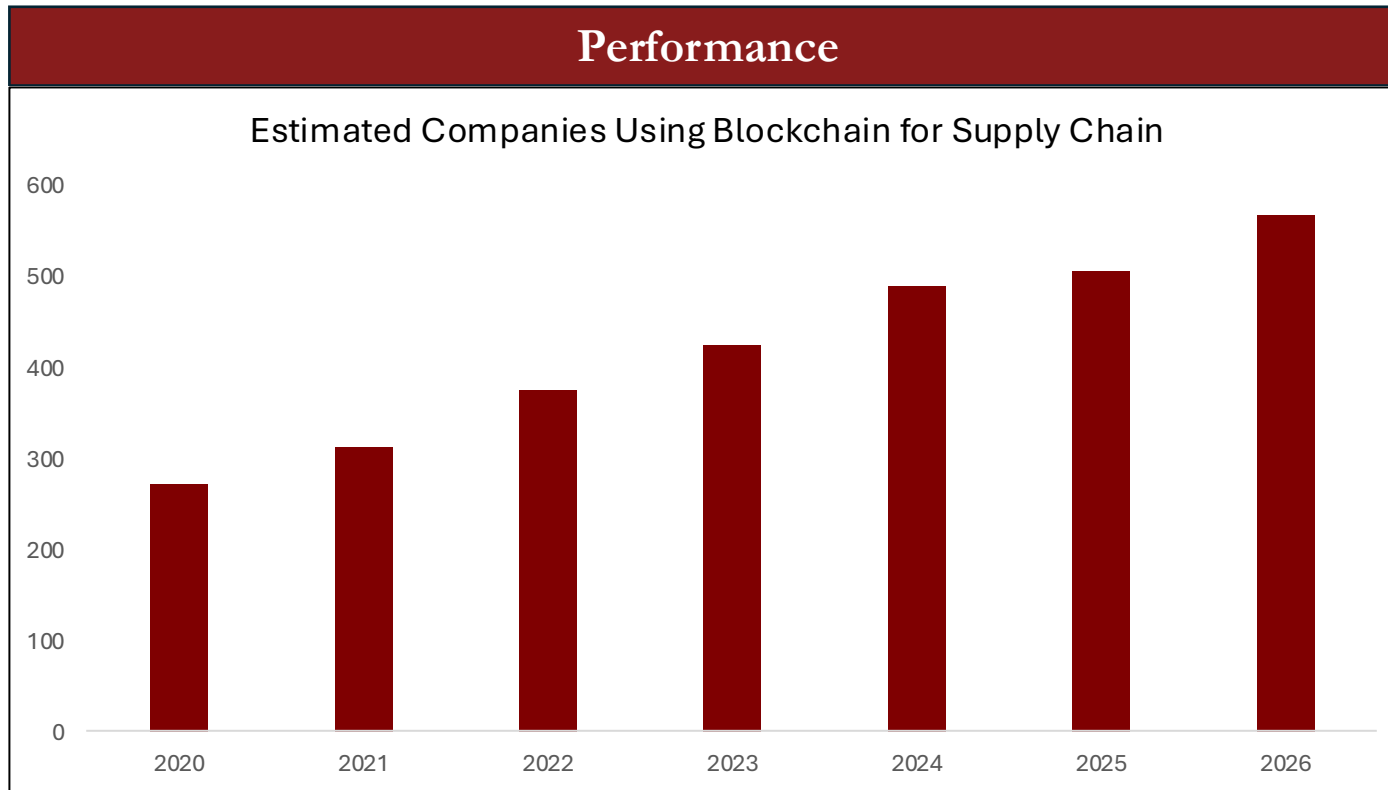

Pitch Team: Charan Vijay & Ben Scott

May 2026

Overview

For Bose to maintain its strong position in the electronics and technology sector, it is crucial that the team can lead in backend efficiency and mitigate problems when dealing with the supply chain space. Major problems like counterfeit risks, complex sourcing, lack of trust in vendors, and general operational inefficiency can be very difficult to resolve. Through our own research at MBF, as well as the research done by Deloitte and IBM, we have found that blockchain technology is the best solution for dealing with these problems.

Why MBF?

BOSE

- Strong passion and knowledge for Blockchain
- Incentive for high-quality research (DormDAO)
- Ample time to help your company
- We work together to help clients
- We invest and engage with the newest, most innovative technology

Minutemen Blockchain Fund

Problems with the Current System

Counterfeits & Fraud

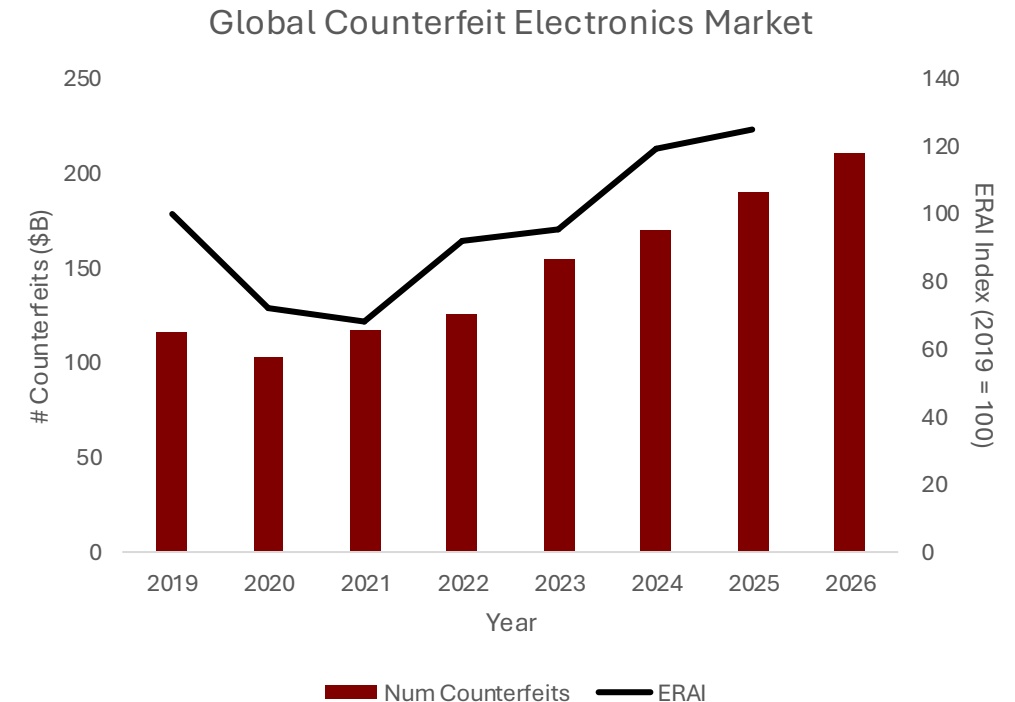

- Ever-increasing number of cheap counterfeits
- Online agreements can be altered after-the-fact

Lack of Speed and Efficiency

- With parts being tracked on multiple systems, organization is a hassle
- Tracing the origins of complex supply chain is difficult

UFLPA & EU's Digital Product Passport

- Require precise proof of origin
- Lack of change can lead to potential legal trouble

Why Blockchain?

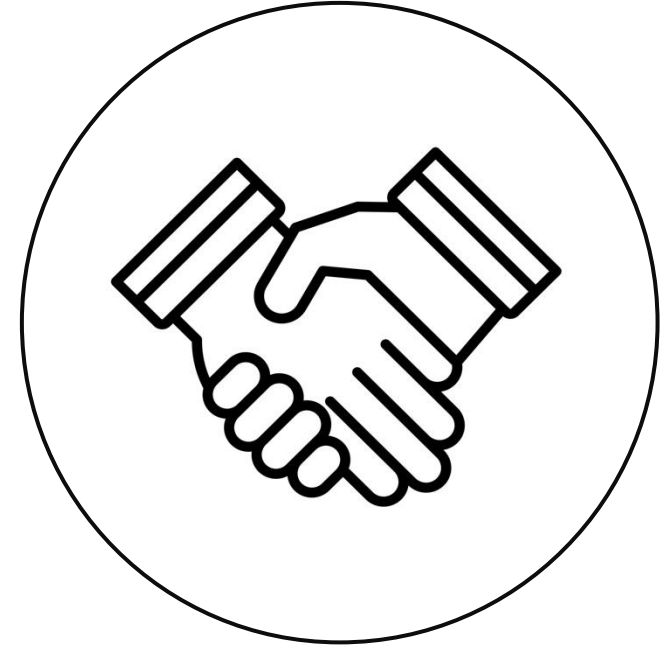

BOSE

Transparency

Security

Compliance

Transparency

Customers Want Proof

For premium speakers, such as Sonus Faber, ethical sourcing is mandatory. Growing numbers of customers are more ethically conscious of sourcing products.

Speed

Bose has struggled with slow component flow, limiting ability to respond to demand changes. Smart contracts and optimal data tracking vastly improve speed.

Complexity is Rising

As Bose grows as a company, the basics of organization is more important than ever. Complex supply chains need strong technology backing it.

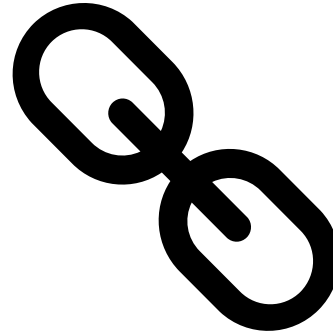

Cost

Excess inventory due to inefficient forecasting leads to unnecessary costs. Maintaining a low inventory while also preventing backorders is a necessity.

Counterfeits

Blockchain gives every Bose product a unique, verifiable digital identity, making it nearly impossible for counterfeits to pass as authentic.

Tamper-Proof Supply Chain

A blockchain ledger locks every action into an immutable record. With the growing number of cybersecurity threats, blockchain makes for a strong solution.

Online Agreements

There is no longer a worry that records of contracts will be altered after orders have been placed. Smart contracts secure these agreements.

High-Performance Execution Layer

We propose moving Bose to a Hyperledger based compliance gatekeeper

Digital Product Passport

- Generates a unique passport for every product at point of manufacture
- Records entire lifecycle including origin of materials and labor certifications

Smart Contract Enforcement

- Smart Contracts that execute when a supplier uploads valid, verified labor certificates
- If a supplier fails to meet the ESG standards the system triggers a block on procurement

Customs Facilitation

- Grants customs authorities read only hashes on Bose ledger, officials can instantly validate

This private network allows Bose to control exactly who sees sensitive supplier data while providing regulators with proof that can be audited.

Other Companies

BOSE

Walmart

- Utilized IBM's Hyperledger Fabric to reduce time to trace food origins from 7 days to 2.2 seconds
- Faster traceability allows for recalls, where contaminated batches are pulled not discarding entire inventories
- Scaled from a small pilot of mangoes and leafy greens to a global network involving major partners

BMW

- Uses a blockchain platform to track components across thousands of global plants and supplier locations.
- Ensures every spare part is verified as genuine from the moment of production
- Provides end-to-end traceability for raw materials, ensuring batteries meet ethical labor standards.

De Beers

- Created the first "Digital Twin" for diamonds, successfully registering over 3 million gemstones on an immutable ledger.
- Assigns a unique digital ID to every diamond at the mine, ensuring customers are 100% certain their purchase is a natural, non-counterfeit stone
- Automatically verifies that diamonds are sourced from conflict-free zones, meeting the high ESG (Environmental, Social, and Governance) demands of modern consumers

DE BEERS
JEWELLERS

Loss From Untracked Items

- Premium Electronic brands lose up to 5% of total retail value
- Potential \$150 Million lost opportunity
- Implementing a Serial Ledger
- Allows illicit channels to be found and shut down

Administrative & Manpower

- Bose uses a JIT II program with on-site supplier representatives
- Shifting to Hyperledger requires investment in technical talent
- System will provide single truth
- Shift completely from data verification to strategic oversight

Sustainability & Resources

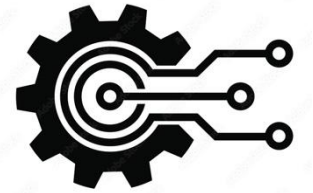

- Significantly reduce amount of safety stock held
- Precise tracking gives more efficient logistical routing
- Foundation for circular economy
- Tracks life cycle of high value materials so they can be recycled

These financial and sustainability justifications make Blockchain the only solution for Bose.

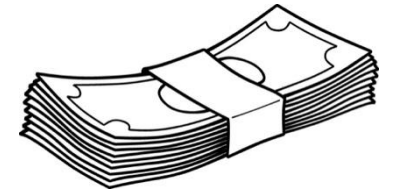

Supplier Adoption – Smaller or overseas suppliers may lack the tools or expertise to adopt Blockchain technology, so providing lightweight onboarding is very helpful

Technical Complexity – Switching over to a new system takes a lot of energy and time, which is why we recommend slow adoption

ROI Uncertainty – There is still not a lot of data on specific profits from implementing blockchain, so reaching out to other companies can be a useful tool for understanding finances.

Legal & Compliance – Blockchain is an evolving technology that still has many legal gray-areas due to the lack of laws. Until the Clarity Act is passed to offer more legal support, stick with trustworthy companies like Hyperledger.

Roadmap & Timeline

Phase 1: Foundation and Pilot Program (Year 1: 2026)

Deploy a private Fabric network at primary manufacturing hubs

A high value product line, like the QuietComfort headphones, would pilot the digital product passport system

The top 20 Tier-1 suppliers will be onboarded and integrate basic tracking to secure the starting record of every unit

Phase 2: Network Scaling and Smart Integration (Year 2: 2027)

Scaling the network across the global supplier ecosystem and integrating the blockchain with SAP and ERP systems

Activate smart contracts to automate the gatekeeper function, payments only released once suppliers upload certifications

Incorporates AI predictive logistics, to anticipate disruptions and reroute shipments before disruptions occur

Phase 3: Ecosystem Maturity and Consumer Transparency (Year 3: 2028)

Extending visibility into Tier-2 and Tier-3 raw material suppliers to meet all regulatory mandates

Launch a consumer-facing verification feature within the Bose App where customers can scan their product's NFC tag

Will instantly confirm its authenticity and view a verified sustainability report about its journey from the component factory

Blockchain offers Bose a wide range of benefits to modernize and optimize its supply chain. The technology of immutable ledgers provides complete visibility, security protection against thieves and counterfeits, and it strengthens compliance with new mandates like the EU Digital Product Passport. As shown by other large companies like Walmart, BMW, and De Beers, this technology performs extremely well in practice when dealing with complex and large supply chains. By adopting Blockchain, Bose will thrive in supply chain management, and lead the industry in security, organization, and ethical practices.
